

## Track To Me

TrackToMe was designed to track incoming packages from courier companies such as UPS and FEDEX for hotel guests and convention attendees. TrackToMe uses the latest barcode, mobile computing and proof-of-delivery technology to efficiently track any inventory you need to manage all on a web based data platform.

The proprietary bar code tracking system employed by TrackToMe allows customers to track and control product flow within their own facility. For most companies, the internal tracking of products before and after the actual shipping is problematic unless a coherent data base management system is in place. Our web based bar code system provides the shipper, receiver and end user with real time information necessary for all three to run their businesses efficiently and cost effectively.

### HOW IT WORKS:

- Hand held bar code reader scans all incoming packages and pallets
- Our software stores package information until you elect to remove it
- Instant text message or email notification to hotel guests
- Hard copy acceptance and billing statement for your guests to sign

### GUESTS BENEFITS:

- Instant text message or email notification of package arrival
- Informs where and when to pick-up and sign for their package
- Pre-arrange any return shipments in advance

### HOTEL BENEFITS:

- Eliminates receiving dock errors when logging in packages
- All package data archived for up to six months
- No need for hotel guests to call front desk for package information
- Package information can be viewed by all authorized personnel
